Exercise: A Microsimulation model – The Sick-Sicker model

In this exercise, we will model the hypothetical Sick-Sicker disease using a microsimulation model. The Sick-Sicker disease has been previously modeled as a Markov model using four health states (Figure 1): Healthy (H); two disease states, Sick (S1) and Sicker (S2); and Dead (D).

One of the advantages of using a microsimulation implementation is the ability to incorporate variation in the baseline characteristics for every individual. To illustrate this, we assume that individual mortality rates depend on baseline characteristics.

The model incorporates the following:

- i) The mortality rates depend on age
- ii) The improvement on quality of life by the treatment varies across individuals through a characteristic that acts as a treatment effect modifier. All model parameter values and R variable names are presented in Table 1.

After you have successfully implemented the natural history of the Sick-Sicker disease as a microsimulation, you can expand the model to include the possibility of treatment and evaluate whether it is cost-effective given a willingness to pay of \$20,000. This hypothetical treatment improves the quality of life for those in the Sick (S1) state but not for those in the Sicker (S2) state. However, it is not possible to distinguish between individuals in the Sick state from those in the Sicker state, so under a treatment strategy, individuals in both sick states must be treated (and incur the costs of treatment), while only those in the sick state benefit from it. Treatment parameters are also summarized in the table below.

Tasks

There are quite some steps you need to take in order to create a microsimulation reflecting this case. Download the all the materials as a folder.

1. Open the “microsim_Sick-Sicker_template.Rmd” template to load the data for the time dependency and the individual characteristics. This templates makes use the files called `mortProb.csv` and `MyPopulation-AgeDistribution.csv`. Start adjusting the `Probs()`, `Costs()` and `Eff()` functions to incorporate the new case.
2. Simulate a population of 100,000 individuals and plot the resulting distributions of remaining lifetime costs and QALYs.
3. Expand your microsimulation to include the possibility of the hypothetical treatment for the Sick-Sicker disease (and its impact on costs and quality of life). Create a new variable that can be used to turn treatment on and off in the model.
4. Simulate a population of 100,000 individuals under a treatment strategy where anyone who is sick (in the Sick or Sicker states) receives treatment. Plot the resulting distributions of remaining lifetime costs and QALYs.
5. Calculate the incremental cost-effectiveness ratio (ICER) of treatment compared to no treatment.

Table 1: Input parameters for the time dependent Sick-Sicker Microsimulation

Parameter	R name	Value
Time horizon	<code>n_t</code>	30 years
Cycle length		1 year

Parameter	R name	Value
Names of simulated individuals	n_i	1000
Names of health states	v_n	H, S1, S2, D
Annual discount rate (costs/QALYs)	d_e d_c	3%
Population characteristics		
- Agedistribution	—	Range:25-55 distributed as in MyPopulation-AgeDistribution.csv
Annual transition probabilities		
- Disease onset (H to S1)	p_HS1	0.15
- Recovery (S1 to H)	p_S1H	0.5
- Disease progression (S1 to S2)	p_S1S2	0.105
Annual mortality		
- All-cause mortality (H to D)	p_HD	Human Mortality Database: age dependent from 2015
- Probability of death is S1 (S1 to D)	p_S1D	0.0149
- Probability of death in S2 (S2 to D)	p_S2D	0.048
Annual costs		
- Healthy individuals	c_H	\$2,000
- Sick individuals in S1	c_S1	\$4,000
- Sick individuals in S2	c_S2	\$15,000
- Dead individuals	c_D	\$0
- Additional costs of sick individuals treated in S1 or S2	c_trt	\$12,000
Utility weights		
- Healthy individuals	u_H	1.00
- Sick individuals in S1	u_S1	0.75
- Sick individuals in S2	u_S2	0.50
- Dead individuals	u_D	0.00
Intervention effect		
- Utility for treated individuals in S1	u_trt	0.95
Time varying extension of Sick-Sicker model		
- Treatment effect modifier at baseline	v_x	Uniform(0.95, 1.05)

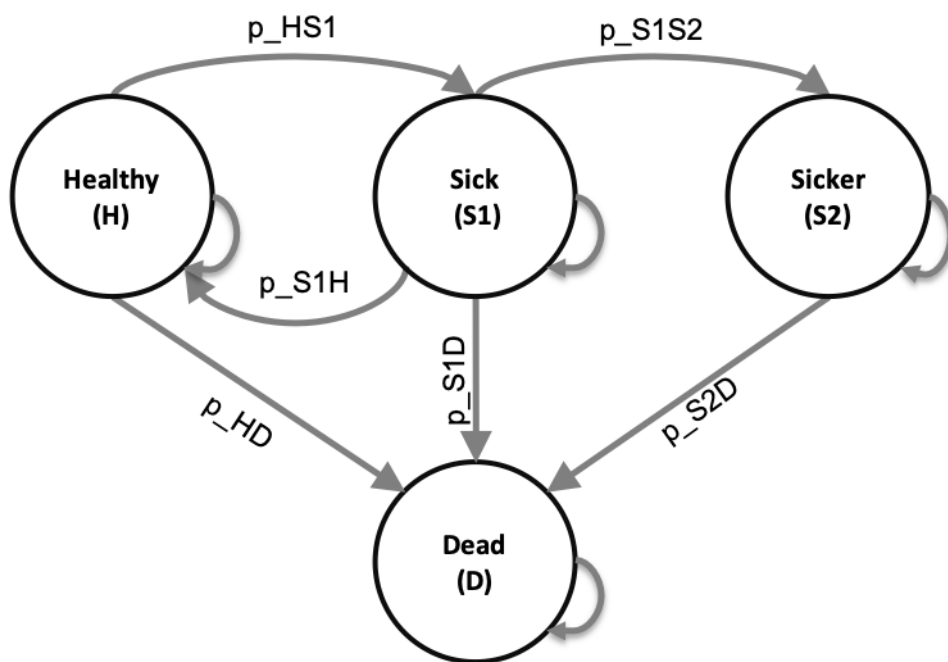

Figure 1: Schematic representation of the Sick-Sicker model
