SA: Markov Sick-Sicker model in R

The DARTH workgroup

Developed by the Decision Analysis in R for Technologies in Health (DARTH) workgroup:

Fernando Alarid-Escudero, PhD (1)

Eva A. Enns, MS, PhD (2)

M.G. Myriam Hunink, MD, PhD (3,4)

Hawre J. Jalal, MD, PhD (5)

Eline M. Krijkamp, MSc (3)

Petros Pechlivanoglou, PhD (6,7)

Alan Yang, MSc (7)

In collaboration of:

- 1. Drug Policy Program, Center for Research and Teaching in Economics (CIDE) CONACyT, Aguas-calientes, Mexico
- 2. University of Minnesota School of Public Health, Minneapolis, MN, USA
- 3. Erasmus MC, Rotterdam, The Netherlands
- 4. Harvard T.H. Chan School of Public Health, Boston, USA
- 5. University of Pittsburgh Graduate School of Public Health, Pittsburgh, PA, USA

v_dwe \leftarrow 1 / (1 + d_e) ^ (0:n_t)
```

Create a state-transition diagram of the cohort model

04 Define and initialize matrices and vectors

04.1 Cohort trace

```
head(m_M_notrt) # show first 6 rows of the matrix

# The cohort starts as healthy
m_M_notrt[1, ] <- m_M_trt[1, ] <- c(1, 0, 0, 0) # initiate first cycle of cohort trace</pre>
```

04.2 Transition probability matrix

Fill in the transition probability matrix:

```
# from Healthy
m_P_notrt["H", "H" ] <- (1 - p_HD) * (1 - p_HS1)
m_P_notrt["H", "S1" ] <- (1 - p_HD) * p_HS1</pre>
m_P_notrt["H", "D" ] <- p_HD</pre>
# from Sick
m_P_notrt["S1", "H"] <- (1 - p_S1D) * p_S1H
m_P_notrt["S1", "S1"] <- (1 - p_S1D) * (1 - (p_S1H + p_S1S2))</pre>
m_P_notrt["S1", "S2"] <- (1 - p_S1D) * p_S1S2</pre>
m_P_notrt["S1", "D" ] <- p_S1D</pre>
# from Sicker
m_P_notrt["S2", "S2"] <- 1 - p_S2D</pre>
m_P_notrt["S2", "D" ] <- p_S2D
# from Dead
m_P_notrt["D", "D" ] <- 1</pre>
# Check that transition probabilities are in [0, 1]
check_transition_probability(m_P_notrt, verbose = TRUE)
# Check that all rows sum to 1
check_sum_of_transition_array(m_P_notrt, n_states = n_states, n_cycles = n_t, verbose = TRUE)
# Overwrite the transition probability matrix for treatment with the no treatment values as they are th
m P trt <- m P notrt
```

05 Run Markov model

```
head(m_M_notrt) # show the first 6 lines of the matrix
```

06 Compute and Plot Epidemiological Outcomes

06.1 Cohort trace

06.2 Overall Survival (OS)

```
# calculate the overall survival (OS) probability for no treatment
v_os_notrt <- 1 - m_M_notrt[, "D"]
# alternative way of calculating the OS probability
v_os_notrt <- rowSums(m_M_notrt[, 1:3])
# create a simple plot showing the OS
plot(0:n_t, v_os_notrt, type = 'l',
    ylim = c(0, 1),
    ylab = "Survival probability",
    xlab = "Cycle",
    main = "Overall Survival")
# add grid
grid(nx = n_t, ny = 10, col = "lightgray", lty = "dotted", lwd = par("lwd"),
    equilogs = TRUE)</pre>
```

06.2.1 Life Expectancy (LE)

```
v_le <- sum(v_os_notrt) # summing probability of OS over time (i.e. life expectancy)</pre>
```

06.3 Disease prevalence

```
v_prev <- rowSums(m_M_notrt[, c("S1", "S2")]) / v_os_notrt
plot(v_prev,
    ylim = c(0, 1),
    ylab = "Prevalence",
    xlab = "Cycle",
    main = "Disease prevalence")</pre>
```

06.4 Proportion of sick in S1 state

07 Compute Cost-Effectiveness Outcomes

```
# Vectors with costs and utilities by treatment

v_u_notrt <- c(u_H, u_S1, u_S2, u_D)

v_u_trt <- c(u_H, u_trt, u_S2, u_D)

v_c_notrt <- c(c_H, c_S1, c_S2, c_D)

v_c_trt <- c(c_H, c_S1 + c_trt, c_S2 + c_trt, c_D)
```

07.1 Mean Costs and QALYs for Treatment and NO Treatment

07.2 Discounted Mean Costs and QALYs

07.3 Compute ICERs of the Markov model

07.4 Plot frontier of the Markov model

```
plot(df_cea, effect_units = "QALYs", xlim = c(15.6, 16.6))
```

08 Deterministic Sensitivity Analysis

08.1 List of input parameters

Create list 1_params_all with all input probabilities, cost and utilities.

```
l_params_all <- as.list(data.frame(</pre>
         = 0.005, # probability to die when healthy
  p_HD
  p_HS1
         = 0.15,
                    # probability to become sick when healthy, conditional on surviving
 p_S1H = 0.5, # probability to become healthy when sick, conditional on surviving
  p_S1S2 = 0.105, # probability to become sicker when sick, conditional on surviving
 hr_S1 = 3,  # hazard ratio of death in sick vs healthy
hr_S2 = 10,  # hazard ratio of death in sicker vs healthy
       = 2000, # cost of remaining one cycle in the healthy state
  с Н
  c_S1 = 4000, # cost of remaining one cycle in the sick state
         = 15000, # cost of remaining one cycle in the sicker state
  c S2
  c_trt = 12000, # cost of treatment(per cycle)
         = 0,  # cost of being in the death state
= 1,  # utility when healthy
  c_D
 u_H
  u_S1 = 0.75, # utility when sick
  u_S2 = 0.5, # utility when sicker
  u_D = 0,
                  # utility when dead
 u_trt = 0.95, # utility when treated
 d_e = 0.03, # discount factor for effectiveness
         = 0.03 # discount factor for costs
 d_c
))
# store the parameter names into a vector
v_names_params <- names(l_params_all)</pre>
```

08.2 Load Sick-Sicker Markov model function

```
source("Functions_markov_sick-sicker_sol.R")
# Test function
calculate_ce_out(l_params_all)
```

08.3 One-way sensitivity analysis (OWSA)

```
options(scipen = 999) # disabling scientific notation in R
# dataframe containing all parameters, their basecase values, and the min and
# max values of the parameters of interest
df_params_owsa <- data.frame(pars = c("p_S1S2", "c_trt", "u_S1", "u_trt"),</pre>
                             min = c(0.05, 6000, 0.65, 0.80), # min parameter values
                             \max = c(0.155, 18000, 0.85, 0.98) # max parameter values
                                          = df_params_owsa, # dataframe with parameters for OWSA
owsa nmb <- run owsa det(params range
                                                             # list with all parameters
                          params_basecase = l_params_all,
                          nsamp
                                          = 100,
                                                               # number of parameter values
                          FUN
                                          = calculate_ce_out, # function to compute outputs
                                       = c("NMB"), # output to do the OWSA on
= v_names_str, # names of the strategies
                          outcomes
                          strategies
                                          = 120000)
                                                              # extra argument to pass to FUN
                          n_wtp
```

08.3.1 Plot OWSA

08.3.2 Optimal strategy with OWSA

```
owsa_opt_strat(owsa = owsa_nmb, txtsize = 10)
```

08.3.3 Tornado plot

```
owsa_tornado(owsa = owsa_nmb)
```

08.4 Two-way sensitivity analysis (TWSA)

```
FUN = calculate_ce_out, # function to compute outputs
outcomes = c("NMB"), # output to do the TWSA on
strategies = v_names_str, # names of the strategies
n_wtp = 120000) # extra argument to pass to FUN
```

l##08.4.1 Plot TWSA

```
plot(twsa_nmb)
```

09 Probabilistic Sensitivity Analysis (PSA)

```
# Function to generate PSA input dataset
gen_psa <- function(n_sim = 1000, seed = 071818){
 set.seed(seed) # set a seed to be able to reproduce the same results
 df_psa <- data.frame(</pre>

                       nrow = n_sim,
                       ncol = n_str))
colnames(df_e) <- v_names_str</pre>
```

09.1 Conduct probabilistic sensitivity analysis

```
# Run Markov model on each parameter set of PSA input dataset
for(i in 1:n_sim){
    l_out_temp <- calculate_ce_out(df_psa_input[i, ])
    df_c[i, ] <- l_out_temp$Cost
    df_e[i, ] <- l_out_temp$Effect
    # Display simulation progress
    if(i/(n_sim/10) == round(i/(n_sim/10), 0)) { # display progress every 10%
        cat('\r', paste(i/n_sim * 100, "% done", sep = " "))
    }
}</pre>
```

09.2 Create PSA object for dampack

09.2.1 Save PSA objects

09.3 Create probabilistic analysis graphs

```
load(file = "markov_sick-sicker_PSA_dataset.RData")

Vector with willingness-to-pay (WTP) thresholds.

v_wtp <- seq(0, 200000, by = 10000)</pre>
```

09.3.1 Cost-Effectiveness Scatter plot

```
plot(l_psa)
```

09.4 Conduct CEA with probabilistic output

09.4.1 Plot cost-effectiveness frontier

```
plot(df_cea_psa)
```

09.4.2 Cost-effectiveness acceptability curves (CEACs) and frontier (CEAF)

```
ceac_obj <- ceac(wtp = v_wtp, psa = l_psa)
# Regions of highest probability of cost-effectiveness for each strategy
summary(ceac_obj)
# CEAC & CEAF plot
plot(ceac_obj)</pre>
```

09.4.3 Expected Loss Curves (ELCs)

The expected loss is the the quantification of the foregone benefits when choosing a suboptimal strategy given current evidence.

```
elc_obj <- calc_exp_loss(wtp = v_wtp, psa = l_psa)
elc_obj
# ELC plot
plot(elc_obj, log_y = FALSE)</pre>
```

09.4.4 Expected value of perfect information (EVPI)

```
evpi <- calc_evpi(wtp = v_wtp, psa = l_psa)
# EVPI plot
plot(evpi, effect_units = "QALY")</pre>
```
